## INTRODUCTION

No part of this document shall be copied in any form or by any means without the prior written consent of NEC Corporation.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a product described herein or any other liability arising from use of such application. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or of others.

While NEC Corporation has been making continuous effort to enhance the reliability of its products, the possibility of failures cannot be eliminated entirely. To minimize risks of damage to property or injury to person arising from a failure in an NEC product, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.

NEC products are classified into the following three quality grades:

```
"Standard", "Special", "Specific"
```

The "Specific" quality grade applies only to applications developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a product depend on its quality grade, as indicated below. Customers must check the quality grade of each application before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
Specific: Military systems, aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems (medical equipment, etc.) and any other equipment

The quality grade of this product is 'Standard" unless otherwise specified in this document. If customers intend to use this product for applications other than those specified for "Standard" quality grade, they should contact NEC Corporation sales representative in advance.

Anti-radioactive design is not implemented in this product.

## 1. OUTLINE

### 1.1 STRUCTURE AND PRINCIPLE

NL10276BC12-02 module is composed of the amorphous silicon thin film transistor liquid crystal display (a-Si TFT LCD) panel structure with driver LSIs for driving the TFT (Thin Film Transistor) array and a backlight.
The a-Si TFT LCD panel structure is injected liquid crystal material into a narrow gap between the TFT array glass substrate and a color-filter glass substrate.
Color (Red, Green, Blue) data signals from a host system (e.g. PC, signal generator, etc.) are modulated into best form for active matrix system by a signal processing board, and sent to the driver LSIs which drive the individual TFT arrays.
The TFT array as an electro-optical switch regulates the amount of transmitted light from the backlight assembly, when it is controlled by data signals. Color images are created by regulating the amount of transmitted light through the TFT array of red, green and blue dots.

### 1.2 APPLICATIONS

- Display terminal for control system

### 1.3 FEATURES

- High resolution
- High luminance
- High contrast
- Low reflection
- Wide temperature range
- LVDS interface
- Reversible-scan direction
- Selectable 8bit or 6bit digital signals for data of RGB
- Edge light type
- Replaceable lamp for backlight (Inverter less)
- Acquisition product for UL1950 3rd edition/CSA C22.2 No.950-95 (File number: E170632)

### 4.3.2 Working for backlight lamp

( $\mathrm{Ta}=25^{\circ} \mathrm{C}$ Note1)
$\begin{array}{|c|c|c|c|c|c|c|}\hline \text { Parameter } & \text { Symbol } & \text { Min. } & \text { Typ. } & \text { Max. } & \text { Unit } & \text { Remarks } \\ \hline \hline \text { Lamp current } & \text { IBL } & 2.0 & 5.0 & 5.5 & \mathrm{mArms} & \begin{array}{c}\text { at IBL=5.0mArms: } \\ 250 \mathrm{~cd} / \mathrm{m}^{2} \\ \text { Note3 }\end{array} \\ \hline \text { Lamp voltage } & \text { VBLH } & - & 400 & - & \text { Vrms } & \text { Note2,Note3 } \\ \hline \text { Lamp starting voltage } & \text { VS } & 590 & - & - & \text { Vrms } & \begin{array}{c}\mathrm{Ta}=25^{\circ} \mathrm{C} \\ \text { Note2, Note3 }\end{array} \\$\cline { 3 - 7 } \& Oscillation frequency \& FO \& 500 \& - \& - \& Vrms\end{array} $\left.\begin{array}{c}\mathrm{Ta}=0^{\circ} \mathrm{C} \\ \text { Note2, Note3 }\end{array}\right]$

Note1: This product's backlight consists of 2 lamps, and these specifications are for each lamp.

Note2: The lamp voltage cycle between lamps should be kept on a same phase. "VS" and "VBLH" are the voltage value between low voltage side (Cold) and high voltage side (Hot).

Note3: The asymmetric ratio of working waveform for lamps (Power supply voltage peak ratio, power supply current peak ratio and waveform space ratio) should be less than $5 \%$ (See the following figure.). If the waveform is asymmetric, DC (Direct current) element apply into the lamp. In this case, a lamp lifetime may be shortened, because a distribution of a lamp enclosure substance inclines toward one side between low voltage terminal (Cold terminal) and high voltage terminal (Hot terminal).

$$
\begin{aligned}
& \frac{|\mathrm{Pa}-\mathrm{Pb}|}{\mathrm{Pb}} \times 100 \leq 5 \% \\
& \frac{|\mathrm{Sa}-\mathrm{Sb}|}{\mathrm{Sb}} \times 100 \leq 5 \%
\end{aligned}
$$

Pa : Supply voltage/current peak for positive, Pb : Supply voltage/current peak for negative
Sa : Waveform space for positive part, Sb : Waveform space for negative part

Note4: In case "FO" is not the recommended value, beat noise may display on the screen, because of interference between "FO" and " $1 /$ th". Recommended value of "FO" is as following.

$$
\mathrm{FO}=\frac{1}{4} \times \frac{1}{\text { th }} \times(2 \mathrm{n}-1)
$$

th: Horizontal cycle (See "4.9.2 Timing characteristics".)
n : Natural number (1, 2, $3 \ldots \ldots .$.

Note5: Method of lamp cable installation may invite fluctuation of lamp current and voltage or asymmetric of lamp working waveform. When design the backlight inverter, evaluate the fluctuation of lamp current and voltage or asymmetric of lamp working waveform sufficiently.

### 4.3.3 Power supply voltage ripple

This product works, even if the ripple voltage levels are beyond the permissible values as following the table, but there might be noise on the display image.

| Parameter | Power supply voltage | Ripple voltageNote1 <br> (Measure at input terminal of power supply) Unit |  |
| :---: | :---: | :---: | :---: |
| VCC | 3.3 V | $\leq 100$ | $\mathrm{mVp}-\mathrm{p}$ |

Note1: The permissible ripple voltage includes spike noise.

### 4.3.4 Fuse

| Parameter | Fuse |  | Rating | Fusing current | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Type | Supplier |  |  |  |
| VCC | KAB2402202NA31 | Matsuo Electric Co., Ltd. | 2.0 A | 4.0 A | Note1 |
|  |  |  | 24 V |  |  |

Note1: The power supply capacity should be more than the fusing current. If the power supply capacity is less than the fusing current, the fuse may not blow for a short time, and then nasty smell, smoking and so on may occur.

### 4.4 POWER SUPPLY VOLTAGE SEQUENCE

4.4.1 Sequence for LCD panel signal processing board

Note1: In terms of voltage variation (voltage drop) while VCC rising edge is below 3.0 V , a protection circuit may work, and then this product may not work.
Note2: Display signals (D0+/-, D1+/-, D2+/-, D3+/- and CK+/-) and function signals (DPSR and FRC) signals must be Low or High-impedance, exclude the VALID period (See above sequence diagram), in order to avoid that internal circuits is damaged.
If some of display and function signals of this product are cut while this product is working, even if the signal input to it once again, it might not work normally. If customer stops the display and function signals, they should be cut VCC.

### 4.4.2 Sequence for backlight inverter (Option)

Note1: These are the display and function signals for LCD panel signal processing board.
Note2: The backlight inverter voltage (VDDB) should be inputted within the valid period of display and function signals, in order to avoid unstable data display.

### 4.5 CONNECTIONS AND FUNCTIONS FOR INTERFACE PINS

4.5.1 LCD panel signal processing board

Note1: See "4.6 DISPLAY COLORS AND INPUT DATA SIGNALS".
Note2: See "4.8 SCANNING DIRECTIONS".
Note3: Twist pair wires with $100 \Omega$ (Characteristic impedance) should be connected between
LCD panel signal processing board and LVDS transmitter.

### 4.5.2 Backlight lamp

## Attention: VBLH and VBLC must be connected correctly. If customer connects wrongly, customer will be hurt and the module will be broken.

CN2 plug (LCD module side):
BHR-03VS-1 (J.S.T Mfg. Co., Ltd.)
Adaptable socket:

### 4.5.3 Positions of plugs and a socket

4.5.4 Connection between receiver and transmitter for LVDS

Note1: Recommended transmitter THC63LVDM83A (THine Electronics Inc.).
Note2: LSB (Least Significant Bit) - R0, G0, B0 MSB (Most Significant Bit) - R7, G7, B7
Note3: Twist pair wires with $100 \Omega$ (Characteristic impedance) should be connected between LCD panel signal processing board and LVDS transmitter.
Note4: TC4 should be fixed to "High".

### 4.6 DISPLAY COLORS AND INPUT DATA SIGNALS

4.6.1 Combinations between input data signals and FRC signal

This product can display in equivalent to $16,194,277$ in 253 scale and 262,144 colors in 64 scale by combination between input data signals and FRC signal. See following table.

| Combination | Input data signals | CN1-Pin No.1 and 2 | FRC signal | Display colors | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |

These data signals become same grayscale.

### 4.6.3 262,144 colors

This product can display in equivalent to 262,144 colors in 64 scale by combination (2) and (3). (See
"4.6.1 Combinations between input data signals and FRC signal".)
Also the relation between display colors and input data signals is as the following table.

Note1: Measurement conditions are as follows.
$\mathrm{Ta}=25^{\circ} \mathrm{C}, \mathrm{VCC}=3.3 \mathrm{~V}, \mathrm{IBL}=5.0 \mathrm{mArms} / \mathrm{lamp}$, Display mode: XGA, Horizontal cycle $=$ 48.363 kHz , Vertical cycle $=60.0 \mathrm{~Hz}$, DPSR $=$ Low or Open: Normal scan

Optical characteristics are measured at luminance saturation after 20minutes from working the product, in the dark room. Also measurement method for luminance is as follows.

Note2: See "4.10.2 Definition of contrast ratio".
Note3: See "4.10.3 Definition of luminance uniformity".
Note4: These coordinates are found on CIE 1931 chromaticity diagram.
Note5: Product surface temperature: $\mathrm{TopF}=34^{\circ} \mathrm{C}$
Note6: See "4.10.4 Definition of response times".
Note7: See "4.10.5 Definition of viewing angles".

### 4.10.2 Definition of contrast ratio

The contrast ratio is calculated by using the following formula.

$$
\text { Contrast ratio }(\mathrm{CR})=\frac{\text { Luminance of white screen }}{\text { Luminance of black screen }}
$$

### 4.10.3 Definition of luminance uniformity

The luminance uniformity is calculated by using following formula.

$$
\text { Luminance uniformity }(\mathrm{LU})=\frac{\text { Maximum luminance from (1) to (5) }}{\text { Minimum luminance from (1) to (5) }}
$$

The luminance is measured at near the 5 points shown below.

### 4.10.4 Definition of response times

Response time is measured, the luminance changes from "white" to "black", or "black" to "white" on the same screen point, by photo-detector. Ton is the time it takes the luminance change from $90 \%$ down to $10 \%$. Also Toff is the time it takes the luminance change from $10 \%$ up to $90 \%$ (See the following diagram.).

Note1: Display functions are checked under the same conditions as product inspection.
Note2: See the following figure for discharge points.

## 6. PRECAUTIONS

### 6.1 MEANING OF CAUTION SIGNS

The following caution signs have very important meaning. Be sure to read '10.2 CAUTIONS', after understanding this contents!

This sign has the meaning that customer will get an electrical shock, if customer has wrong operations.

This sign has the meaning that customer will be injured by himself, if customer has wrong operations.

### 6.2 CAUTIONS

* Do not touch the lamp cables while turn on. Customer will be in danger of an electric shock.
* Do not touch the backlight while turn on. Customer will be in danger of burn injury.
* Do not shock and press the LCD panel and the backlight! There is a danger of breaking, because they are made of glass. (Shock: To be not greater $539 \mathrm{~m} / \mathrm{s}^{2}$ and to be not greater 11ms, Pressure: To be not greater 19.6N)

### 6.3 ATTENTIONS

### 6.3.1 Handling of the product

(1) Take hold of both ends without touch the circuit board when customer pulls out products (LCD modules) from inner packing box. If customer touches it, products may be broken down or out of adjustment, because of stress to mounting parts.
(2) Do not hook cables nor pull connection cables such as lamp cable and so on, for fear of damage.
(3) If customer puts down the product temporarily, the product puts on flat subsoil as a display side turns down.
(4) Take the measures of electrostatic discharge such as earth band, ionic shower and so on, when customer deals with the product, because products may be damaged by electrostatic.
(5) The torque for mounting screws must never exceed $0.2 \mathrm{~N} \cdot \mathrm{~m}$. Higher torque values might result in distortion of the bezel.
(6) The product must be installed using mounting holes without undue stress such as bends or twist (See outline drawings). And do not add undue stress to any portion (such as bezel flat area) except mounting hole portion.
Bends or twist described above and undue stress to any portion except mounting hole portion may cause display un-uniformity.
(7) Do not press or rub on the sensitive display surface. If customer clean on the panel surface, NEC Corporation recommends using the cloth with ethanolic liquid such as screen cleaner for LCD.
(8) Do not push-pull the interface connectors while the product is working, because wrong power sequence may break down the product.
(9) Do not bend or unbend the lamp cable at the near part of the lamp holding rubber, to avoid the damage for high voltage side of the lamp. This damage may cause a lamp breaking and abnormal operation of high voltage circuit.

### 6.3.2 Environment

(1) Do not operate or store in high temperature, high humidity, dewdrop atmosphere or corrosive gases. Keep the product in antistatic pouch in room temperature, because of avoidance for dusts and sunlight, if customer stores the product.
(2) In order to prevent dew condensation occurring by temperature difference, the product packing box must be opened after leave under the environment of an unpacking room temperature enough. Because a situation of dew condensation occurring is changed by the environmental temperature and humidity, evaluate the leaving time sufficiently. (Recommendation leaving time: 6 hour or more with packing state)
(3) Do not operate in high magnetic field. Circuit boards may be broken down by it.
(4) Use an original protection sheet on the product surface (polarizer). Adhesive type protection sheet should be avoided, because it may change color or properties of the polarizer.

### 6.3.3 Characteristics

## The following items are neither defects nor failures.

(1) Response time, luminance and color may be changed by ambient temperature.
(2) The LCD may be seemed luminance non-uniformity, flicker, vertical seam or small spot by display patterns.
(3) Optical characteristics (e.g. luminance, display uniformity, etc.) gradually is going to change depending on operating time, and especially low temperature, because the LCD has cold cathode fluorescent lamps.
(4) Do not display the fixed pattern for a long time because it may cause image sticking. Use a screen saver, if the fixed pattern is displayed on the screen.
(5) The display color may be changed by viewing angle because of the use of condenser sheet in the backlight unit.
(6) Optical characteristics may be changed by input signal timings.
(7) The interference noise of input signal frequency for this product's signal processing board and luminance control frequency of customer's backlight inverter may appear on a display. Set up luminance control frequency of backlight inverter so that the interference noise does not appear.

### 6.3.4 Other

(1) All GND, backlight inverter ground (GNDB), VCC and backlight inverter power supply voltage (VDDB) terminals should be used without a non-connected line.
(2) Do not disassemble a product or adjust volume without permission of NEC Corporation.
(3) See "REPLACEMENT MANUAL FOR LAMP HOLDER", if customer would like to replace backlight lamps.
(4) Pay attention not to insert waste materials inside of products, if customer uses screwnails.
(5) Pack the product with original shipping package, because of avoidance of some damages during transportation, when customer returns it to NEC Corporation for repair and so on.
